Project Description:

The WaterSat Imaging Spectrometer Experiment (WISE) for optically shallow inland and coastal waters assessment (the WISE-Man project)'s objective was to demonstrate the potential of hyperspectral imagery for mapping bathymetry, water column quality (or inherent optical properties) and retrieve bottom properties in order to respond to the pressing needs of science (e.g. ecology, geomorphology, coastal risk), resource management and defense operation. Within this framework ,an intensive fieldwork campaign was conducted in the Manicouagan / Baie-Comeau region (Québec, Canada) in July-August 2019. The database includes several datasets (csv files) of bathymetric data, samples with a multibeam (MBES) and a monobeam (Hydroball).
